WANTACE SOLUTIONS

SPRINT ASSIGNMENT

Submitted by: T Hemanth

Selected Business: S PRINTING WORLD

Location: Asilmetta, Visakhapatnam, Andhra Pradesh

Assignment Topic: Business Process Audit, Requirements Analysis, Account Executive Handoff and Marketing Creatives

Submission Date: 18 October 2026

PART A: SMALL BUSINESS PROCESS AUDIT

1. Business Information

Business Name: S PRINTING WORLD

Business Location: Asilmetta, Visakhapatnam, Andhra Pradesh

Business Type: Printing Services

Owner's Name: To be confirmed during the interview

Interview Date: To be completed after the interview

Interview Method: In-person, phone, or video call

Interview Duration: Minimum 20 minutes

2. Objective

The objective of this audit is to understand how a small printing business manages customer orders, records requirements, schedules printing work, tracks pending jobs, delivers completed orders, and records payments.

The audit aims to identify actual operational challenges and recommend practical improvements that suit the business's working methods.

3. Business Overview

S PRINTING WORLD in Asilmetta, Visakhapatnam, is the business selected for this audit. The investigation will focus on the shop's customer-order process, record-keeping methods, work tracking, and delivery coordination.

The specific services offered by the shop and its current operational methods must be confirmed with the owner.

4. Preliminary Process Map

Customer Enquiry → Requirements Collected → Price and Delivery Date Confirmed → Order Recorded → Printing Work Started → Quality Checked → Order Delivered → Payment Recorded

This is a preliminary process map. The final version must reflect the actual workflow confirmed during the interview.

5. Interview Questions

1. What printing services does your business provide?
2. How many orders do you receive on a normal day?
3. How do customers place orders?
4. How do you record customer details, quantities, prices, and deadlines?
5. How do you track pending and completed orders?
6. What are the most common reasons for delays?
7. What happens when customers change their requirements?
8. How do you check the quality of printed materials?
9. How do you record payments and outstanding balances?
10. What is the most difficult part of managing daily orders?
11. Can you describe a recent order that caused a problem?
12. What improvement would make your daily work easier?

6. Findings

The following findings must be completed using information collected during the interview.

Finding 1: Order Recording

Describe the actual method used to record customer requirements and order details.

Finding 2: Order Tracking

Explain how the business identifies pending, in-progress, completed, and delayed orders.

Finding 3: Delays and Rework

Describe any actual delays, design changes, printing errors, or material shortages reported by the owner.

Finding 4: Payment Records

Explain how payments and outstanding balances are recorded and monitored.

7. Owner Quotes

Quote 1: Record the owner's exact words about the biggest operational challenge.

Quote 2: Record the owner's exact words about the improvement they would like.

8. Proposed Improvement

If the interview confirms that order tracking is difficult, a simple digital tracking system could be considered.

The system could record customer details, order descriptions, quantities, prices, promised delivery dates, work status, and payment status.

The recommendation should be based on the actual problems identified rather than assumptions about the business.

9. Evidence

- A hand-drawn process map based on the interview.
- Two photographs of actual business tracking records, with permission.
- A brief explanation of each photograph.
- The actual interview date, method, and duration.
- Business and owner details shared according to the assignment's privacy requirements and with consent.

Private customer information must be hidden before sharing photographs.

10. Conclusion

The audit is intended to understand the real operational process of a small printing business. Direct discussion with the owner and examination of actual records will help identify the most important business problem and determine whether a simple technology solution would be useful.

PART B: VARDHAN STEELWARE REQUIREMENTS DOCUMENT

1. Executive Summary

Vardhan Steelware is a stainless-steel utensils manufacturer in Jagadhri. The company works with distributors and has recently started selling products online.

Its current order-management process uses several tools, including a spreadsheet, a dispatch diary, WhatsApp messages, and Tally for accounting. The case identifies opportunities to improve order visibility, partial-dispatch tracking, payment-hold visibility, and reconciliation of material sent for external polishing.

The recommended first phase is a simple, mobile-friendly order-tracking solution. It should improve visibility without introducing the complexity of a complete ERP system.

2. Business Background

The case identifies the following stakeholders:

- Suresh: Owner who wants visibility into order status.
- Kunal: Maintains the order spreadsheet.
- Ramesh: Handles dispatch and maintains a diary.
- Munshi ji: Manages accounts using Tally.

The company previously implemented an ERP system in 2023 costing ₹1.2 lakh. It was abandoned after approximately three months because it was too complex.

This experience shows that usability, simplicity, and employee adoption are important design considerations.

3. Current Problems

3.1 Information Is Spread Across Different Tools

Order information is stored in a spreadsheet, dispatch information is maintained in a diary, some updates arrive through WhatsApp, and accounting is managed in Tally.

Impact: Employees may need to check several sources to understand an order's current status.

3.2 Limited Order Visibility

The owner wants to view order status on a phone. The current process does not appear to provide a single consolidated view.

Impact: The owner may need to request manual updates from employees.

3.3 External Polishing Reconciliation

Products are sent to outside polishing workers. The case reports a 3–4% steel difference and a 6 kg shortage in one lot.

Impact: Without clear records of quantities and weights sent and returned, discrepancies may be difficult to investigate.

These reported figures should be investigated rather than treated as proof that every transaction has the same problem.

3.4 Partial Dispatches and Payment Holds

The supplied information includes WhatsApp updates about partial dispatches, delayed polishing, and payment holds.

Impact: Staff need to distinguish completed work from work that is blocked, delayed, or awaiting dispatch.

3.5 Data-Quality Problems

The supplied order information contains duplicate-looking rows, a missing customer name, a negative return quantity of -6 dozen, and inconsistent rate or unit information.

Impact: Incomplete or inconsistent records may cause confusion during order processing and reconciliation. Suspicious entries should be checked rather than automatically deleted.

4. Project Objectives

The proposed solution should:

1. Give the owner a clear view of order status on a phone.
2. Make delayed and blocked orders easy to identify.
3. Track partial dispatches and remaining quantities.
4. Record material sent for polishing and material returned.
5. Improve completeness and consistency of order records.
6. Reduce the need to search multiple tools for routine updates.

5. Proposed Solution

5.1 Central Order Register

Each order should have a unique order ID and include customer details, product information, quantities, units, order date, expected delivery date, and current status.

Required fields should be validated. Duplicate-looking records should be flagged for review.

5.2 Order Status Tracking

Suggested statuses:

- New
- Confirmed
- In Production
- Sent for Polishing
- Polishing Returned
- Ready for Dispatch
- Partially Dispatched
- Dispatched
- On Hold
- Completed

The business should agree on the meaning of each status before implementation.

5.3 Owner Dashboard

The dashboard should show:

- Active orders
- Orders due soon
- Delayed orders
- Orders on payment hold
- Orders awaiting polishing return
- Partially dispatched orders
- Completed orders

The dashboard should be mobile-friendly and easy to understand.

5.4 External Polishing Register

For every polishing transaction, record:

- Order or batch reference
- Supplier or polishing worker
- Date sent
- Quantity and weight sent
- Quantity and weight returned
- Date returned
- Difference recorded
- Explanation and follow-up status

Recorded differences should be flagged for investigation.

5.5 Dispatch Tracking

Record the dispatch date, dispatched quantities, remaining quantities, and reason for partial dispatch.

An order should not be marked completed while required quantities remain outstanding unless it has been cancelled or otherwise formally resolved.

5.6 Payment-Hold Tracking

Authorized users should be able to record a hold reason and its resolution status.

Sensitive financial information should only be accessible to authorized employees. Tally should remain the accounting system during the first phase.

6. Users and Responsibilities

Owner: View overall order progress and delays.

Order Manager: Create and update order records.

Dispatch Staff: Record dispatches and remaining quantities.

Accounts Staff: Confirm payment status and holds.

Polishing Coordinator: Record material sent out and returned.

The system should provide appropriate access permissions and a history of important changes.

7. Project Scope

Included in Phase 1

- Central order register
- Mobile-friendly status dashboard
- Order-stage updates
- Partial dispatch tracking
- External polishing reconciliation
- Basic data validation
- Delay and hold indicators
- User access controls and change history

Excluded from Phase 1

- AI-based demand prediction

- Full Amazon and Flipkart integration
- Replacement of Tally
- Complete ERP replacement
- Advanced analytics requiring additional clean historical data

These features can be considered later after the core workflow is reliable and employees have adopted the system.

8. Functional Requirements

FR-1: Authorized users shall be able to create orders with unique IDs.

FR-2: Authorized users shall be able to update order status.

FR-3: The dashboard shall display active, delayed, blocked, and completed orders.

FR-4: The system shall record partial dispatches and remaining quantities.

FR-5: The system shall record quantities and weights sent for polishing and returned.

FR-6: The system shall flag recorded discrepancies for investigation.

FR-7: Authorized users shall be able to record payment holds and their reasons.

FR-8: The system shall validate required fields and flag inconsistent entries.

FR-9: Important changes shall be traceable.

FR-10: The owner shall be able to view order status on a mobile phone.

9. Non-Functional Requirements

Usability: Employees should be able to learn the main workflow quickly.

Performance: Order searches and updates should be responsive.

Security: Access should be restricted according to user responsibilities.

Reliability: Records should be backed up and recoverable.

Data Quality: Required fields, units, and quantities should be validated.

Maintainability: The solution should be straightforward to support.

Adoption: The workflow should fit existing business operations.

10. Acceptance Criteria

The first phase will be ready for pilot testing when:

1. An authorized user can create and search for an order.
2. The owner can view the latest order status on a phone.
3. Partial dispatches are distinguishable from completed orders.
4. Polishing records show quantities or weights sent and returned.
5. Recorded discrepancies are flagged for review.
6. Orders on payment hold are clearly identified.
7. Incomplete or inconsistent records are flagged.
8. Relevant employees can complete a sample order workflow after brief training.

11. Implementation Plan

Stage 1 — Validate Requirements: Review the spreadsheet, dispatch diary, WhatsApp workflow, and external polishing process.

Stage 2 — Prepare Data: Agree on unique order IDs, units, statuses, and mandatory fields.

Stage 3 — Build the Prototype: Implement the order register, status updates, dashboard, and dispatch records.

Stage 4 — Add Reconciliation: Implement and test external polishing tracking.

Stage 5 — Pilot: Test a small number of orders and collect user feedback.

Stage 6 — Roll Out: Train employees, maintain backups, and monitor adoption.

12. Risks and Mitigations

Risk: Employees do not adopt the system.

Mitigation: Keep the workflow simple and provide training.

Risk: Existing data is inconsistent.

Mitigation: Validate and clean sample data.

Risk: Incorrect status updates.

Mitigation: Define statuses and assign responsibilities.

Risk: Polishing differences are disputed.

Mitigation: Record quantities, dates, and confirmations.

Risk: The system becomes too complex.

Mitigation: Limit Phase 1 to essential features.

Risk: Sensitive information is exposed.

Mitigation: Use access controls and secure backups.

13. Success Measures

Record baseline measurements before the pilot and compare them afterward.

Suggested measures include:

- Time needed to answer an order-status enquiry
- Number of orders with missing information
- Number of delayed orders identified before the promised date
- Accuracy of remaining quantities after partial dispatch
- Percentage of polishing transactions reconciled
- Employee usage and feedback

Targets should be agreed after measuring the current process.

14. Final Recommendation

Vardhan Steelware should begin with a simple, mobile-friendly order-tracking solution focused on order visibility, partial dispatches, payment holds, and external polishing reconciliation.

The previous ERP experience demonstrates the importance of simplicity and adoption. AI predictions and full marketplace integration should be considered only after the core records are reliable and employees are comfortable with the new process.

PART C: ACCOUNT EXECUTIVE HANDOFF

Client: Vardhan Steelware

1. Client Need

The client needs a straightforward way to monitor order status and coordinate production, dispatch, payment holds, and external polishing.

2. Current Challenges

- Information is distributed across several tools.
- The owner wants mobile access to order status.
- Partial dispatches and payment holds need clearer tracking.

- External polishing requires better quantity and weight reconciliation.
- A previous ERP system was abandoned because it was too complex.

3. Recommended First Phase

Propose a mobile-friendly order-tracking solution with a central order register, status dashboard, delayed-order indicators, partial dispatch tracking, polishing reconciliation, and basic data validation.

4. Out of Scope Initially

Do not promise AI predictions, full marketplace integrations, replacement of Tally, or a complete ERP system in Phase 1.

5. Questions to Confirm

1. Who will create and update each order?
2. Which order fields are mandatory?
3. How should duplicate-looking records be handled?
4. How should partial dispatches be recorded?
5. What polishing differences require investigation?
6. Who can access payment-hold information?
7. What devices and internet access are available?
8. What budget and timeline are acceptable?

6. Next Step

Arrange a requirements-validation meeting with the owner, order manager, dispatch staff, and accounts representative. Review a sample order from entry to delivery and agree on the minimum viable product before development begins.

PART D: MARKETING CREATIVES

D1. LinkedIn Post

Better Visibility Starts with Better Workflows

A business does not always need a complicated ERP system to improve its operations.

Sometimes, the first step is simply making sure everyone can see the same order status.

When order details are spread across spreadsheets, diaries, messages, and accounting tools, employees can spend valuable time searching for updates instead of moving work forward.

A practical first step is to create a clear order register, define workflow statuses, track partial dispatches, and identify delays early.

Start with the process people already understand. Make it easier to use. Measure the improvement. Expand only when the business is ready.

The best business software is not the one with the most features. It is the one the team can actually use.

#BusinessOperations #DigitalTransformation #SmallBusiness #WorkflowImprovement

D2. Meta Advertisement Concept

Objective: Generate enquiries from small manufacturers and businesses that manage customer orders manually.

Target Audience: Small-business owners, workshop managers, and manufacturing operations managers.

Primary Text:

Still checking spreadsheets, diaries, and WhatsApp messages to find an order's latest status?

A simple order-tracking workflow can help your team see what's pending, what's delayed, and what's ready for dispatch.

Start small. Improve visibility. Make daily work easier.

Headline: Know the Status of Every Order

Description: Simple, practical order tracking for growing businesses.

Call to Action: Learn More

Creative Direction: Show a paper order register on one side and a simple mobile order-status dashboard on the other. Use a clean layout that is easy to read on a phone. Avoid fabricated customer testimonials or unverified performance claims.

Success Metrics: Track enquiries, click-through rate, cost per enquiry, and relevant business conversations generated.
